BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

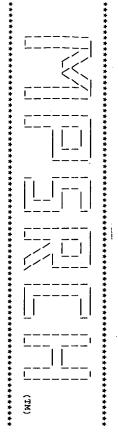

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problems Mailbox.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

abular output not generated. p on: Tue Apr 20 13:57:56 1999; MasPar time 4.85 Seconds 174.525 Million cell updates/sec

Description: Perfect Score: Title: >US-08-836-455-2 (50-66) from US08836455.pep (2 of 3)

Scoring table: PAM 150 Gap 11 Sequence:

1 GINLHWLQQEPDGTIKR 17

Searched: 165420 segs, 49795644 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

1:sp_archea 2:sp_bacteria 3:sp_fungi 4:sp_human 5:sp_invertebrate 6:sp_mammal 7:sp_mhc 8:sp_organelle 9:sp_bhage 10:sp_plant 11:sp_rodent 12:sp_unclassified 13:sp_vertebrate 14:sp_virus

Statistics: Mean 27.617; Variance 43.342; scale 0.637

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pri against human milk fat globule disease associated tumours,

Prespecially breast cancer

SC Claim 9; Page 94; 130pp; English.

C This polypeptide sequence comprises the light chain variable region

C (VL) of monoclonal anti-idiotype antibody 11D10 produced by

hybridoma cell line ATC 12020. 11D10 was obtained by immunising

C naive mice with MC-10 anti-HMFG antibody to obtain an anti-idiotype

C response. It elicits an immune response against a specific epitope

C induces an immunological response to HMFG in mice, rabbits, monkeys

C and patients with advanced HMFG-associated tumours. Pharmaceutical

and/or 11D10 polynucleotides (see also T85149-50) are claimed.

C and/or 11D10 polynucleotides (see also T85149-50) are claimed.

C polypeptides and/or 11D10 polynucleotides, including methods of

treating HMFG-associated tumours. 1D10 is also used in a claimed

detect or quantify anti-HMFG antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

Production of catalytic antibodies displayed on phage - by generating a gene library of antibody-derived domains and expressing ferrating a gene library of antibody-derived domains and expressing it in phage vectors

Disclosure; Fig 9; 133pp; English.

T04625 encodes R80078 mouse derived light chain RT3 phage antibody. The DNA was used in the prepn. of catalytic antibody (CA) producing bacteriophage. The CAs can be used to activate/deactivate a biological function in an animal by enhancing the rate of cleavage,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PT neutralising heavy metals

Claim 23; Page 70; 106pp; English.

CC Hybridoma antibodies have been produced with the spleen cells of CC BALB/c mouse that had received multiple injections of mercuric ions CC covalent compound which was covalently bound to keyhole limpet CC enacted with glutathione to produce a mercuric ion coordinate CC covalent compound which was covalently bound to keyhole limpet CC enacted with glutathione to produce a mercuric ion coordinate CC covalent compound which was covalently bound to keyhole limpet CC enacted with glutathione was covalently bound to keyhole limpet CC enacted with glutathione was solated from hybridoma cells with CC glundine isothiocyanate. First strand cDNA synthesis was cattalysed CC were complementary to the 5' end of the CHI domain of the heavy CC the C kappa domain. Some of the primers used for cDNA synthesis are CC chain expressed by the hybridoma of interest, or to the 5' and of CC the C kappa domain. Some of the primer used for cDNA synthesis are CC crafable region of a particular antibody polypeptide was also used CC an appropriate V-region primer. In addition, the VH primer Q97518 CC was used to amplify the mab 2D5 and 5B6 heavy chains. The sequences CC in Q97488-Q97510 and the deduced AA sequences in R7921-R79250 & CC R78970-R78971. The descriptions of the SEO ID nos given on pp 44-45 cc used here.

CC laim 23; Page 62; 105pp; English.

CC Hybridoma antibodies have been produced with the spleen cells of CC Hybridoma shibodies have been produced a mercuric ions of mercuric ions of reacted with glutathione to produce a mercuric ion coordinate CC covalent compound which was covalently bound to keyhole limpet the heavy straint glutathione to produce a mercuric ion coordinate CC themocyanin (KLH). Eight hybridomas (IFIO, 4AIO, ICLI, 564, 23F8, 2D5, 586 and 3E8) were producing MAbs that were strongly positive against glutathione expressed by the producing MAbs that were strongly positive against glutathione at the complementary to the 5° and of the CH domain of the carlysed CC were complementary to the 5° and of the CH domain of the heavy CC chain expressed by the hybridoma of interest, or to the 5° and of CC the C kappa domain. Some of the primer used for cDNA synthesis are CC variable region of a particular antibody polypeptide was also used CC variable region of a particular antibody polypeptide was also used CC and appropriate V-region primer. In addition, the VH primer Q97518 CC was used to amplify the mab 2D5 and 586 heavy chains. The sequences CC in G97498-Q97510 and the deduced AA sequences in R79241-R79250 & CC and in the claims are different from the descriptions in the sequence listings. The descriptions of the SEQ ID nos given on pp 44-45 cused here.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               by Multur reverse transcriptase. The primers used for CDNA synthesis chair expressed by the hybridoma of interest, or to the 5' and of the CH domain of the heavy the C kappa domain. Some of the primers used for cDNA synthesis are shown in 097511-097518. The primer used for cDNA synthesis of the variable region of a particular antibody polypeptide was also used for PCR amplification of that variable region, in conjunction with a papropriate v-region primer. In addition, the VH primer 097518 was used to amplify the mAb 2D5 and 596 heavy chains. The sequences of the PCR amplified nucleotides were determined. These are given in 097498-097510 and the deduced AA sequences in R79241-R79250 & R79370-R78971. The descriptions of the SEQ ID nos given on pp 44-45 and in the claims are different from the descriptions in the sequence listings. The descriptions in the sequence listings are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Eight hybridomas (1F10, 4A10, 1C11, 564, 2378, 2D; 5B6 and 3E8) were producing Mabs that were strongly positive against glutatione-mercuric ions but negative against glutathione without mercuric ions. RNA was isolated from hybridoma cells with guanidine isothiocyanate. First strand cDNA synthesis was catalysed
display package.

Example 46; Fig 52; 109pp; English.

The sequence is the light chain of clone MIF encoding an scFv fragment specific for both hen and turkey egg lysozyme (HEL and TEL).

The DNA encoding the chain was amplified from a cDNA library prepd. from the spleen of an unimmunised mouse. The corresponding heavy chain was also amplified from an existing construct, pSWI-VHD1.3 (Ward et al. 1989). The two fragments were assembled via a linker to prepare an scFv construct which was ligated into the fdCAT2 vector for expression on the surface of fd bacteriophage. In this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pilus; g3p; bindi

520C9 anti-c-erbB-2 two single chain Fv construct.
520C9; anti-c-erbB-2 monoclonal antibody; single chain construct; polypeptide linker; C-terminal amino acid sein vivo imaging; drug targetting experiment; homodimer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example; Page 40-41; 68pp; English.

The pref. vector or plasmid of the invention has a double-stranded DNA seq. coding for a variable region of a light or heavy chain of IGG, or for a variable region of a light or heavy chain of a immunoglobulin specific for an enzyme or surface protein. The sequence esp. codes for a variable region of a light chain having in the protein of a variable region of a light chain having sep. including the D region of the heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Moore KW, Zaffaroni A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              way, the VL domain was replaced by a library of VL domains to allow for selection of a broader range of antibody specificities. Several clones were isolated which bound to TEL (the parent antibody D1.3 binds exclusively to HEL). The sequences of the light chains of two of these clones, MF1 and M21 are given in R21310 and R21311 respectively. The D1.3 light chain is given in R21309. antigen for imaging or treating breast or ovarian cancer etc. Sclaim 4; pages 60-61; 87pp; English.

C c-erbB-2 refers to a protein antigen expressed on the surface of tumour cells. such as breast and ovarian tumour cells, which is an 2C approx. 200,000 mol. wt. acidic glycoprotein having an isolelectric pt. of about 5.3 (see Q46083, R39568). A single chain Fv (sFv) class a covalently linked VH-VL heterodimer which is expressed from a gene fusion including VH- and VL- encoding genes connected by ca peptide-encoding linker. Such linker sequences are set forth in 2C a peptide-encoding linker. Such linker sequences are set forth 1 claim for the 16 AA collinker sequences in R39572. Using Q46084 for the 520C9 monoclonal claim for the 16 AA collinker sequences in R39572. Using Q46084 for the 520C9 monoclonal claim for the 520C9 monoclonal collinker sequences are set forth in 2C antibody, a single chain polypeptide can be produced having a

Example 1; Columns: 33-36; 30pp; English.

CC Variable heavy (VH) and variable light (VL) genes were cloned from cc antibody constant and joining regions. A two single chain Fv (sFv) columns was constructed by connecting the VH and VL genes with a cc gene was constructed by connecting the VH and VL genes with a cc which encodes the present sequence, was inserted into an expression cc westor, transformed into E. coll, and protein expression induced by compsn. compsising a carrier and the 2 sFv protein prod. Is a homodiner, in which both fragments target the same antigen, therefore giving greater binding avidity and cc longer tissue retention times, compared to individual sFv protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The CC variable heavy chain sequence of C179Fv-PP is shown in R92829. These CC sequences form an anti-human influenza A type virus antibody. The CC antibody recognises the stem region of the haemagglutinin (HA) molecule of the HIN1 and H2N2 subtypes of human influenza A type virus, and shows concurratisation activity against these two subtypes. The antibody shows on recognition of the H3N2 subtype. This sequence and the variable light chain coding sequence (see T04160) are useful in the production of cartificial antibodies and antipolen-binding polypeptides. These artificial antibodies and polypeptides are useful in the diagnosis and treatment of human influenza. As the antibodies recognise the stem region of the HA colecule, the influenza virus will be recognised even if the HA molecule changes. This provides an advantage over current vaccines, as the virus sequence 255 AA;

The antibody recognises the stem region of the haemagylutinin (HA) molecule of the HIN1 and HAN2 subtypes of human influenza A type virus, and shows neutralisation activity against these two subtypes. The antibody shows no recognition of the HIN2 subtype. The DNA encoding this sequence and the variable hevay chain coding sequence (see T04159) are useful in the production of artificial antibodies and antigen-binding polypeptides. These artificial antibodies and encigen-binding polypeptides. These artificial antibodies influenza. As the antibodies recognise the stem region of the HA molecule, the influenza virus will be recognised even if the HA molecule changes. This provides an advantage over current vaccines, as the virus sequence of the hamperiodically alters it's HA molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                           LT 14

New human monoclonal antibodies to hepatitis C virus E2 antigen obtained using a combinatorial antibody library prepared using RNA from a HCV infected subject, useful for vaccine preparation claim 5; Fig 2E; 103pp; English.

The present sequence represents the alpha light chain peptide sequence of the Fab molecule, clone L1. This immunoglobulin molecule is capable of specifically binding with the hepatitis C virus (HCV) E2 antigen. The present sequence was obtained from a combinatorial antibody library. The alpha light chain peptide can be used to construct a recombinant human monoclonal antibody (MAb). The monoclonal antibodies exhibit immunological binding affinity for HCV E2 antigen and are cross-reactive with different HCV strains. They can be used to produce vaccine compositions which can be used to provide antibodies to HCV in a subject or to provide passive immunity or to treat HCV infected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29-APR-1998 (first entry)

CC subjects. They can also be used to detect HCV and to monitor anti-HCV CC therapeutic treatment.

CC note: this sequence is allegedly encoded by T88837; however, the cc peptide encoded by that nucleotide sequence differs considerably to the CC present peptide.

Statistics: Mean 25.001; Variance 40.079; scale 0.624

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

           Klein, U.; Kueppers, R.; Rajewsky, K.
submitted to the EMBL Data Library, September 1993
Human IgM(+)IgD(+) cells, the major B cell subset i
peripheral blood, expresses V(kappa) genes with I
little somatic mutation throughout life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         J. Immunol. (1989) 142:3158-3163
Structural and idiotypic characterization of the L chains
human IgM autoantibodies with different specificities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Goni, F.R.; Chen, P.P.; McGinnis, D.; Fernandez, J.; Carson, D.; Solomon, Frangione, B.

                                                                                                                                                                                                                           immunoglobulin heterotetramer subunit consists of two identical light (Kappa or lambda) and two identical heavy (alpha, delta, epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into larger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nitrophenyl phosphonate-specific antibody 48G7 light chain vJ

Title: >US-08-836-455-2
Description: (99-107) from US08836455.pep (3 of 3)
Perfect Score: 68

Sequence: 1 ESEDFVAYY 9

Scoring table: PAM 150 Gap 11

Searched: 74019 seqs, 26840295 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot35 1:swissprot

Statistics: Mean 25.463; Variance 33.115; scale 0.769

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 24.693; Variance 34.950; scale 0.707

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

abular output not generated.

Title: Description: Perfect Score: >US-08-836-455-1_1 (89-97) from trans.pep (3 of 3) 54 1 SDYSLTISS 9

Sequence:

Scoring table: PAM 150 Gap 11

Searched: 116695 seqs, 37453910 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

Statistics:

pir58 1:pir1 2:pir2 3:pir3 4:pir4

Mean 22.382; Variance 27.684; scale 0.808

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
